JIHAD MAASARANI

Full-Stack Developer | PHP/Symfony, Python, React, PostgreSQL, Redis, Docker

Beirut | +961 71 919 075 | jihadismasarani@gmail.com | linkedin.com/in/jihad-masarani-13631b225 | Remote, 4 PM–12 AM

SUMMARY

Full-stack developer who owns features end to end, from REST APIs and backend services to React and Angular interfaces, SQL databases and Docker deployment. Built and took live a budget-forecasting platform at Murex that cut each forecast from ~8 hours to 10 minutes for ~50 users, and built a trading evaluation dashboard on PHP/Symfony, React, PostgreSQL and Redis.

PROFESSIONAL EXPERIENCE

Technology Consultant | EY *Beirut | Feb 2026 – Present*

- Delivered rollout workflows across multiple entities for a Saudi government client by owning the backend business rules and building the front-end UI on ServiceNow App Engine.
- Turned loosely defined stakeholder requirements into a working request-management application, and configured demand-management workflows for Qatar University.
- Shaped architecture and on-premise deployment decisions across concurrent engagements, through to rollout.

Full Stack Software Developer Intern | Murex *Beirut | Jun 2025 – Aug 2025*

- Cut each budget forecast from ~8 hours to 10 minutes (~98%) for ~50 users by building ITBF (IT Budget Forecast) from scratch, replacing manual per-location, per-fiscal-year asset calculations.
- Brought asset data into one place by integrating the ServiceNow API into PostgreSQL, and built C#/.NET 9 REST APIs and services that filter assets by criteria (e.g. laptops, headsets, maternity leave) and location.
- Automated fiscal-year forecasting with a calculation service that applies user-entered employee growth and inflation rates, recalculating budgets instantly in the Angular UI as asset managers change filters.
- Secured every page and endpoint by building a role-based access control (RBAC) system with .NET middleware enforced across the whole platform.
- Replaced manual sign-off with an approval workflow: managers review budgets read-only, add notes and approve, while requesters track status and then follow live spent and remaining amounts.
- Took the platform live on Murex virtual machines with Docker Compose, HTTPS/TLS (certificates coordinated with the Windows team), Microsoft SAML SSO, CI/CD and unit-tested logic.

Software Engineer | Lebanese News Aggregator (team project, mentored by a Meta engineer) *Remote | Jan 2025 – Jun 2025*

- Aggregated 6 Lebanese news sources into one platform by building the Python RSS collection pipeline, organizing articles with Pandas DataFrames for downstream processing.
- Let users browse news by their chosen sources and date ranges by building FastAPI endpoints that query MongoDB and return filtered responses, plus the React filtering interface connected to them.
- Delivered the platform with teammates who owned article summarization, aggregation and MongoDB storage, keeping source references for every aggregated article.

SELECTED PROJECTS

Trading Evaluation Dashboard | PHP, Symfony, React, PostgreSQL, Redis, Docker

- Built a simulated prop-trading evaluation platform, with a Symfony REST API and React UI, that lets users run challenges with configurable starting balances, profit targets and maximum-loss limits.
- Tracked trader performance accurately by implementing trade recording, profit/loss, win-rate and equity calculations and challenge-status logic, with users, challenges and trades stored in PostgreSQL.
- Kept dashboards fast by caching summaries in Redis with invalidation on trade changes, added Redis-backed API rate limiting, and containerized the stack with Docker Compose.

MediLog | Java, Spring Boot, React, MongoDB, Docker

- Gave users one place to manage their health records by building a full-stack platform (React, Spring Boot, MongoDB) for medications, vaccinations and lab results.
- Let patients share records with doctors safely through temporary doctor-access links secured with JWT and Spring Security, and containerized the app with Docker for repeatable deployment.

AUBIFY | React, Node.js, Express, MongoDB, Socket.io

- Connected AUB students on one platform by building a React and Node.js/Express app on MongoDB with posts, comments, stories, JWT authentication and user profiles.
- Enabled real-time communication by building live chat with Socket.io and connection-based friend suggestions.
- Kept the platform safe by building an admin interface for managing users and moderating content.

TECHNICAL SKILLS

Backend & APIs: PHP/Symfony, Python, FastAPI, C#/.NET 9, Node.js/Express, Java/Spring Boot, RESTful APIs, webhooks, third-party APIs
Frontend & data: React, Angular, JavaScript, TypeScript | SQL, PostgreSQL, MongoDB, Redis (caching, rate limiting), Pandas
DevOps & security: Docker, Docker Compose, CI/CD, Linux, Git, unit testing, SAML SSO, JWT, HTTPS/TLS
Ways of working: debugging, code review, requirements analysis, technical documentation, Agile, Jira

EDUCATION & CERTIFICATIONS

B.S. Computer Science, American University of Beirut (Jan 2023 – Dec 2025) | GPA 3.86/4.0, Dean's Honor List, full scholarship
Oracle Certified Professional, Java | AI Programming with Python Nanodegree (Udacity, sponsored by AWS) | ServiceNow CSA, CAD, CIS-DF
